Echo — Feature Spec (v1)

Oct 30, 2026 · @Andrej

Overview

Echo v1 is LoroNote for Android: the same offline, on-device Whisper transcription feature set, rebuilt natively for Android phones and Wear OS. LoroNote is iOS-only, so Android is uncovered.

Guiding principle: match LoroNote feature-for-feature unless Android forces a different implementation. Where it does, use the closest Android-native equivalent (for example, Wear OS for Apple Watch, Google Play for the App Store).

One deliberate difference: LoroNote's AI notes and action items only work on Apple Intelligence devices. Echo's notes and tasks must work on every supported phone, because automatic task creation is part of Echo's core promise.

Platforms & device requirements

Echo ships on Android phones, tablets and Wear OS. No account is required, which matches LoroNote.

Area	LoroNote	Echo v1
Phone / tablet	iPhone, iPad (iOS 18.6+)	Android phones and tablets, minimum Android version TBD (proposed Android 10, API 29)
Watch	Apple Watch app + watch-face complication (watchOS 11.6+)	Wear OS app + tile + watch-face complication
On-device transcription	iPhone 13+, SE 3rd gen, recent iPads	Device tiers. The bundled Whisper model is sized to each tier, with Large V3 Turbo on the top tier
Desktop	None	None
Account	Not required	Not required

Requirements

- Detect device tier on install from RAM, SoC and available accelerators, then ship the matching model.
- Devices below the lowest tier see a clear "not supported" message instead of a broken experience.
- Large-screen layouts for tablets and foldables (LoroNote supports iPad).

Transcription engine

Echo runs Whisper Large V3 Turbo fully on-device through our own inference engine. It works offline, including in Airplane Mode, which matches LoroNote.

Requirement	LoroNote	Echo v1 target
Model	Whisper Large V3 Turbo	Whisper Large V3 Turbo on the top tier; smaller Whisper variants on lower tiers
Offline	Yes, including Airplane Mode	Yes, including Airplane Mode
Speed	~19× real time on iPhone 15 Pro (claimed)	Proposed: ≥10× real time on a current flagship (e.g. Pixel 9, Galaxy S24). Measure on a fixed 60-minute benchmark file
Accuracy	Up to 98% (claimed)	Track word error rate per language on a public test set. Don't publish a % until it's measured
Background	Keeps running when locked or in another app	Foreground service with a progress notification; survives screen-off and app switching
Recording length	No hard limit	No hard limit; long files are processed in chunks
Languages	100+, offline, incl. Slovenian	All Whisper languages, offline, incl. Slovenian

Requirements

- Auto-detect the language, with a manual override per recording.

- A transcription interrupted by the OS or a reboot resumes from the last finished chunk.
- Model upgrades download automatically in the background (Wi-Fi only by default).

Speaker diarization

Echo detects speakers on-device and labels each segment, the same way LoroNote has since v3.6.5.

- Automatic speaker detection with a distinct color label per speaker.
- Rename a speaker once and every segment updates (bulk rename).
- Manually reassign the speaker for one segment, a group of segments, or a text selection.
- Speaker labels are kept in TXT and SRT exports and when sharing.
- Runs fully offline, after transcription or alongside it.

AI notes & tasks

Echo offers the same three AI features as LoroNote, generated by an on-device LLM on every supported phone. Unlike LoroNote, they don't depend on a vendor AI platform such as Apple Intelligence.

Feature	LoroNote	Echo v1
Summary	Apple Intelligence devices only	All supported devices
Action items	Apple Intelligence devices only; stay in the app	All supported devices; become in-app tasks
Transcript polishing	Apple Intelligence devices only	All supported devices

Requirements

- Generate the summary and action items automatically after each transcription. Users can turn this off in settings.
- Action items become tasks with a title, optional due date and a link back to the moment in the transcript.
- Tasks can be edited, ticked off and deleted in the app.

- Polishing removes filler words and fixes punctuation. The original transcript is always kept and can be restored.
- Everything runs offline; no text leaves the device.

Recording & import

Echo records on the phone and the watch and imports audio and video files, just like LoroNote.

Feature	LoroNote	Echo v1
Record on device	iPhone, iPad	Android phone, tablet
Record on watch	Apple Watch, syncs to iPhone	Wear OS, syncs to phone over the Wearable Data Layer
One-tap record	Home Screen widgets	Home-screen widget, plus a Quick Settings tile
Import	MP3, M4A, WAV, MP4, MOV and more	MP3, M4A, WAV, OGG, OPUS, AAC, MP4, MOV, WEBM and more
Import entry point	In app, share sheet	In app (file picker), and Echo as an Android share target

Requirements

- Recording continues with the screen off and shows an ongoing notification with pause/stop.
- Phone calls and other audio interruptions pause the recording and resume it afterwards.
- Watch recordings transcribe on the phone automatically once synced.

Editing & organization

Echo matches LoroNote's editor and library one-to-one.

- **Playback-synced editor:** the current line highlights during playback. Tapping a line jumps the audio to that timestamp.
- **Search & replace** within a transcript, plus search across all transcripts.

- **Custom dictionary** for names and jargon, used as a prompt/bias for Whisper so those words transcribe correctly.
- **Folders** with a custom name, color and icon.
- **Calendar view** that lists recordings by day.

Export & sharing

Echo exports the same three formats as LoroNote and shares through the Android share sheet.

- **TXT**: plain transcript, with speaker labels and optional timestamps.
- **SRT**: subtitles with timings, with speaker labels.
- **Original audio**: the source file as recorded or imported.
- **Share:** the Android share sheet, for any app the user has installed.
- **Free tier:** export is limited (see Pricing).

Privacy

All processing happens on the device, and no audio, transcript or note is ever uploaded. This matches LoroNote.

Area	LoroNote	Echo v1
Processing	On-device, no servers	On-device, no servers
Audio upload	Never	Never
Sync / backup	Optional, user's own encrypted iCloud	Optional, encrypted backup to the user's own Google Drive (open question)
Store disclosure	App Store label: purchase history only	Play Data safety: no data collected, except purchase history via Google Play
Analytics	Not stated	None in v1, or opt-in only (open question)

Pricing & tiers

Echo copies LoroNote's four plans and price points, billed through Google Play. Local EUR pricing is set in the Play Console.

Plan	Price (USD)	Includes
Free	$0	First 2 minutes of each recording transcribed; unlimited recordings; limited export
Monthly	$4.99 / month	Everything; cancel anytime
Yearly	$19.99 / year	Everything (~$1.67 / month)
Lifetime	$39.99 one-time	Everything; no renewals

- Purchases are restored through Google Play, so no account is needed.
- The paywall appears when a recording passes 2 minutes or when the user exports beyond the free limit.

Out of scope & open questions

Out of scope for v1 (LoroNote doesn't have these either):

- Desktop or web apps
- A meeting bot that joins Zoom, Teams or Meet
- Live, real-time transcription
- Export to Markdown, DOCX or PDF
- Sending tasks to Todoist, Google Tasks or Google Calendar

Open questions

- [ ] Minimum Android version, and the RAM/SoC cut-offs for each device tier
- [ ] Which on-device LLM runs notes and tasks, and how it fits on lower-tier devices next to Whisper
- [ ] Do we ship Google Drive backup in v1, or launch local-only?
- [ ] No analytics at all, or opt-in crash reporting?
- [ ] Exact free-tier export limit (LoroNote doesn't publish theirs)
- [ ] Should task sync (Todoist, Google Tasks, Calendar) be the first post-v1 feature, since LoroNote can't do it?
